

Technology

I wanted to take this class because a lot of science programs require you to organize your results in a coding site in order to format the results with statistical analysis. I would like to take coding in R class in the future because research primarily uses R to analyze research data.

Personally I believe that technology and society drive each other. Almost like an arms race between the two. Society is always evolving and so technology is made to make society better and society adapts to new technology when it is made. I believe it is possible to live a lifestyle without modern electronic technology but it would be a lot harder. I however think it would be almost impossible to live without tool technology. For example you can live without your phone but to live without a knife or house would be hard. In my opinion I think the next era of technology will be labor robots. There are so many laborious jobs humans take a long time to do and robots can do much more efficiently. For example I just met a guy who codes robots to do these types of things. His company just finished and released a robot that can fold clothes in large retail stores like Target and walmart.
